

IN THE CLAIMS:

Please add new claims 40-42 as follows:

1-21. (canceled).

22. (previously amended) A method, comprising:
generating a netlist model for a circuit;
providing a virtual delay element in the netlist model;
providing a virtual clock signal to the virtual delay element to influence a desired race resolution for the circuit; and
generating a test pattern to test the circuit in accordance with the virtual clock signal for the virtual delay element.

23. (previously presented) The method as recited in claim 22, further comprising:
selectively providing a virtual delay element for respective sequential elements in the circuit in accordance with respective race resolution requirements of the respective sequential elements.

24. (previously presented) The method of claim 22, wherein the virtual clock signal is identified as a primary input of an automatic test pattern generation (ATPG) system.

25. (previously presented) The method of claim 24, wherein the virtual clock signal is specified by a user of the ATPG system in accordance with a physical characteristic of the circuit.

26. (previously presented) The method of claim 25, wherein the physical characteristic comprises a delay characteristic.

27. (previously presented) The method of claim 26, wherein the delay characteristic corresponds to a length of conductive paths between circuit elements.

28. (previously amended) A system, comprising:
a processor; and
a memory coupled to the processor, the memory storing a program adapted to:
generate a netlist model for a circuit;
provide a virtual delay element in the netlist model;
provide a virtual clock signal to the virtual delay element to influence a
desired race resolution for the circuit; and
generate a test pattern to test the circuit in accordance with the virtual
clock signal for the virtual delay element.
29. (previously presented) The system as recited in claim 28, wherein the program is
further adapted to selectively provide a virtual delay element for respective sequential
elements in the circuit in accordance with respective race resolution requirements of the
respective sequential elements.
30. (previously presented) The system of claim 28, wherein the virtual clock signal is
identified as a primary input of an automatic test pattern generation (ATPG) system.
31. (previously presented) The system of claim 30, wherein the virtual clock signal is
specified by a user of the ATPG system in accordance with a physical characteristic of
the circuit.
32. (previously presented) The system of claim 31, wherein the physical characteristic
comprises a delay characteristic.
33. (previously presented) The system of claim 32, wherein the delay characteristic
corresponds to a length of conductive paths between circuit elements.

34. (previously amended) A set of instructions residing in a storage medium, the set of instructions being capable of execution by a processor to implement a method, the method comprising:

- generating a netlist model for a circuit;
- providing a virtual delay element in the netlist model;
- providing a virtual clock signal to the virtual delay element to influence a desired race resolution for the circuit; and
- generating a test pattern to test the circuit in accordance with the virtual clock signal for the virtual delay element.

35. (previously presented) The set of instructions as recited in claim 34, wherein the method further comprises:

- selectively providing a virtual delay element for respective sequential elements in the circuit in accordance with respective race resolution requirements of the respective sequential elements.

36. (previously presented) The set of instructions of claim 34, wherein the virtual clock signal is identified as a primary input of an automatic test pattern generation (ATPG) system.

37. (previously presented) The set of instructions of claim 36, wherein the virtual clock signal is specified by a user of the ATPG system in accordance with a physical characteristic of the circuit.

38. (previously presented) The set of instructions of claim 37, wherein the physical characteristic comprises a delay characteristic.

39. (previously presented) The set of instructions of claim 38, wherein the delay characteristic corresponds to a length of conductive paths between circuit elements.

40. (newly added) The method of claim 22, wherein the virtual delay element comprises a first virtual delay element and the virtual clock signal comprises a first virtual clock signal, the method further comprising:

providing a second virtual delay element in the netlist model; and

providing a second virtual clock signal to the second virtual delay element, wherein the second virtual clock signal has different timing as compared to the first virtual clock signal.

41. (newly added) The system of claim 28, wherein the virtual delay element comprises a first virtual delay element and the virtual clock signal comprises a first virtual clock signal, wherein the program is further adapted to:

provide a second virtual delay element in the netlist model; and

provide a second virtual clock signal to the second virtual delay element, wherein the second virtual clock signal has different timing as compared to the first virtual clock signal.

42. (newly added) The set of instructions as recited in claim 34, wherein the virtual delay element comprises a first virtual delay element and the virtual clock signal comprises a first virtual clock signal, the method further comprising:

providing a second virtual delay element in the netlist model; and

providing a second virtual clock signal to the second virtual delay element, wherein the second virtual clock signal has different timing as compared to the first virtual clock signal.
